

2050 in a Flash

Welcome back to Future Features. Today, I, Chris Wong, will be describing some global issues, global improvements and innovations that may arise in 2050. Earth has many possible futures, but my ideas are based on what most scientists predict. Let's begin.

Firstly, I would like to talk about the global issues that may arise. Earth is already suffering from global warming and overpopulation, so it is inevitable for most people to think that these issues will get worse in the future. However, that is not what I believe in. Since 2000, many governments have taken measures to prevent such global issues. For example, China imposed the one child policy since 1979 to control the rising population.

Although these measures had adverse effects, they contributed to the main cause. I do think we humans will suffer from a lot of diseases since the ozone layer is thinning and the UV rays are getting stronger. Researchers say that one in every 10 people will have cancer or an ultraviolet (UV) ray related disease. That is alarming, isn't it?

Secondly, I would like to point out some global improvements. Scientists strongly believe that we will completely switch to solar energy one day. Solar panels are becoming cheaper and cheaper. It is obvious that they will be more widely used in the future. As far as I can tell, there aren't much big unrests in the world with a few exceptions, so I believe that all countries will be well developed and will trade freely with one another. Many new international organizations will pop up in all countries, and which will have the same voting powers. No one will dominate, so there will be a fair level playing field.

Finally, I will name a few innovations that may emerge by 2050. As everyone believes, robots will get more popular. They will be efficient enough to do everything. Many scientists also believe that humans will become less developed, so they will need more breathing support and hearing aids. Time travelling will also be possible. There will be a space tours to the moon and the neighboring planets. Earth in the future sounds very exciting!

Earth is our Home and it is our responsibility to take care of it. Let's honour this duty and continue to serving the earth. Our planet could be the most beautiful, heaven-like place with a switch in our mind, turn into a planet full of destruction.
